[1] Train time (min) : Wall time to train for 1M time steps.

[2] Success ratio: number of successful episodes / number of reachable episodes (in this case: number of reachable episodes = 100)
An episode is successful if the distance between the finger tip and the target is less or equal to 0.01.
The length of a robot link is 0.1.

[3] Average reaching time : sum (number of time steps of all successful episodes) / number of successful episodes
An episode has a maximum of 100 time steps.

The RL algorithm used here are from the Stable baselines baselines implementation using the default parameters.

Complexity to add later:

1. Reach target position and orientation
2. Presence of obstacles
3. Target is moving during operation

2 Performance plots - sorted by algorithm

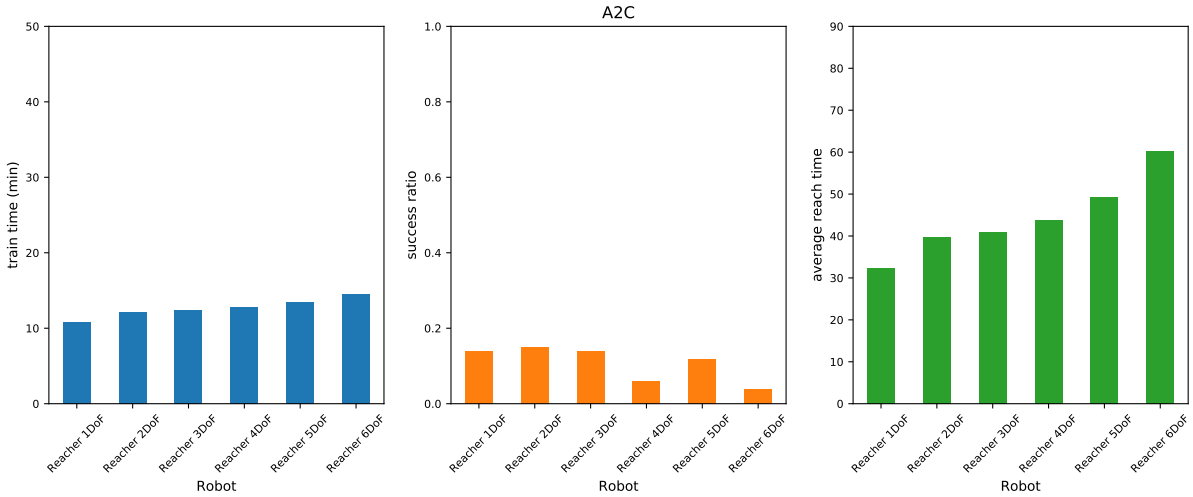

Figure 1: Performance metrics of the A2C algorithm.

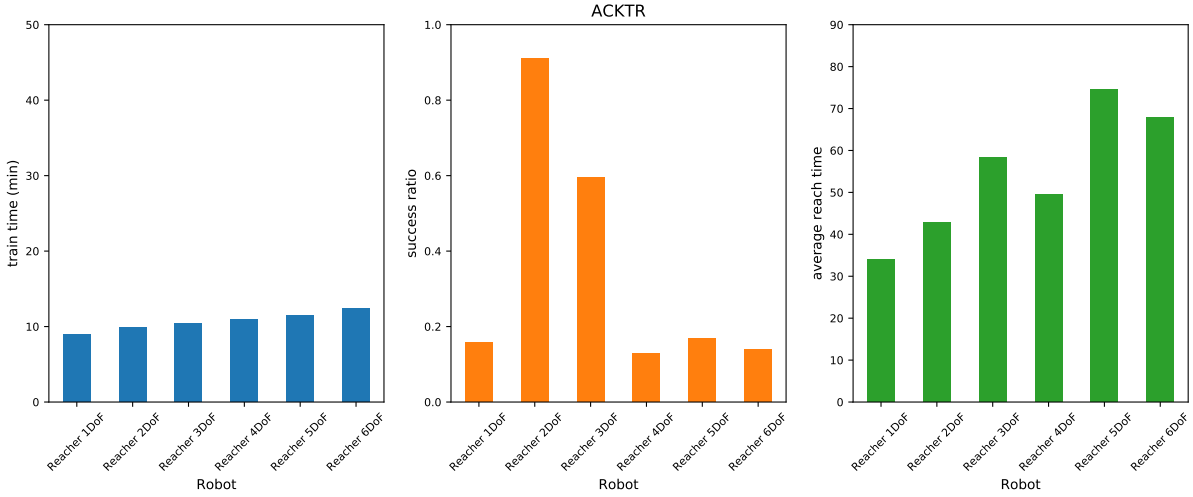

Figure 2: Performance metrics of the ACKTR algorithm.

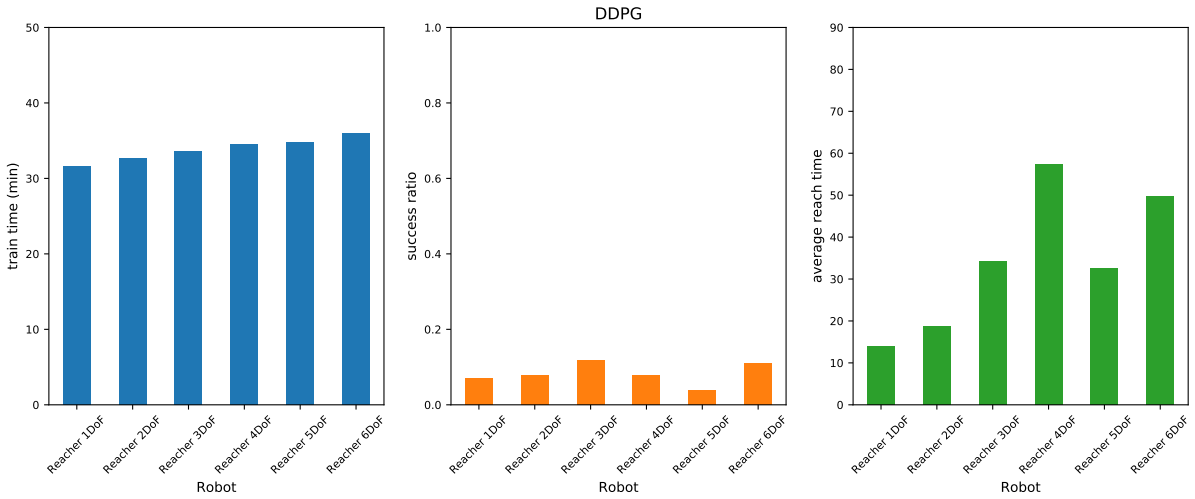

Figure 3: Performance metrics of the DDPG algorithm.

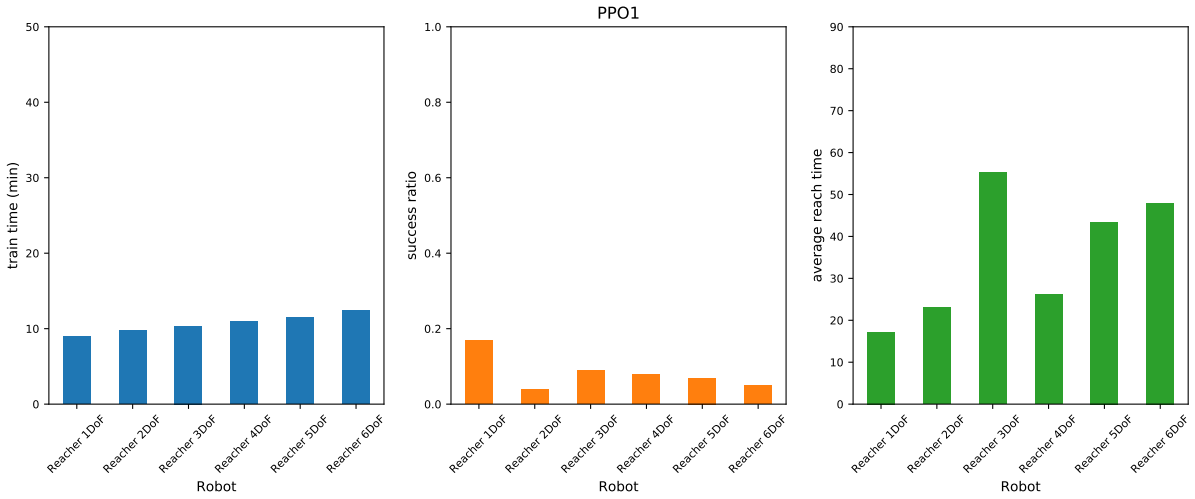

Figure 4: Performance metrics of the PPO1 algorithm.

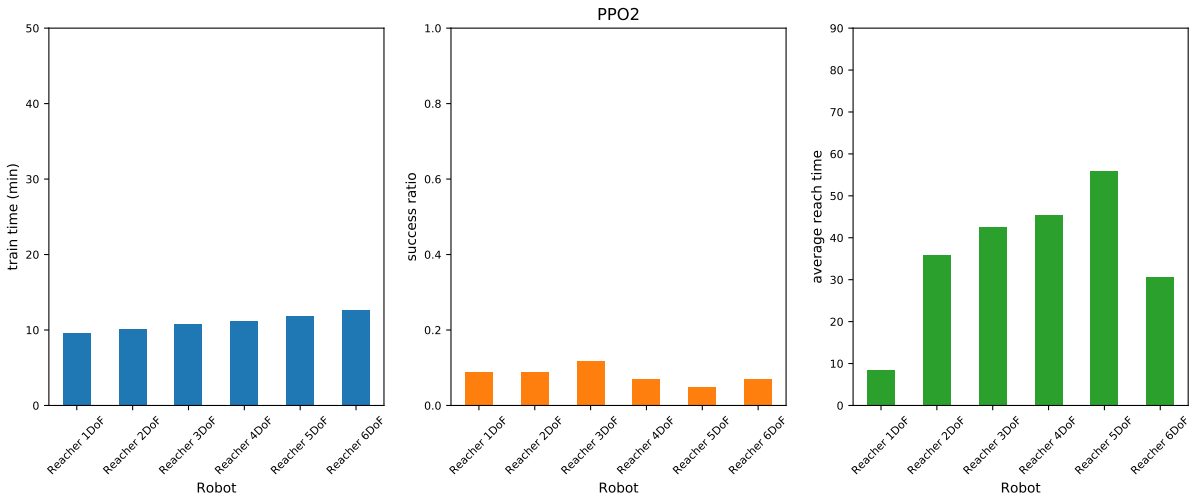

Figure 5: Performance metrics of the PPO2 algorithm.

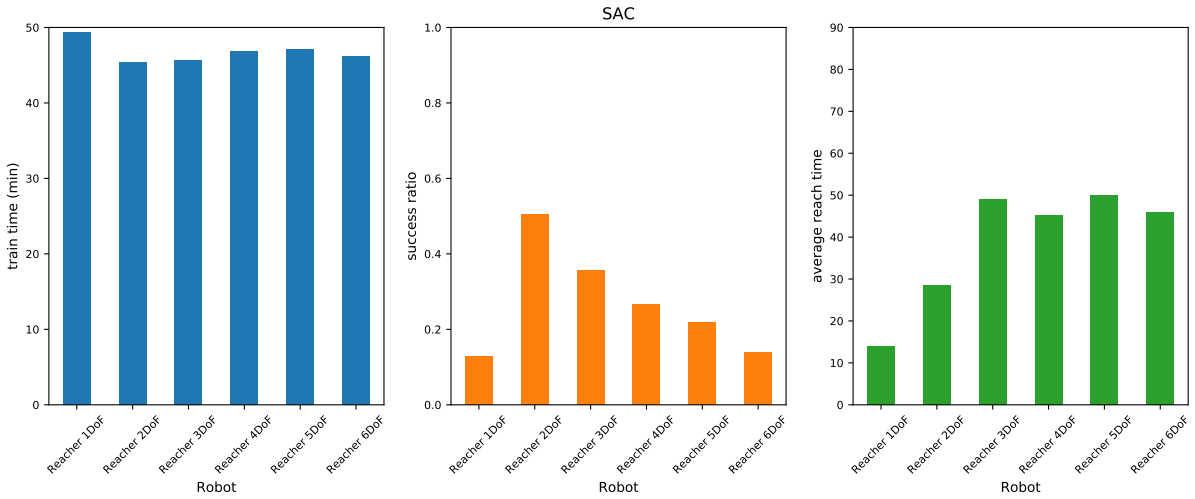

Figure 6: Performance metrics of the SAC algorithm.

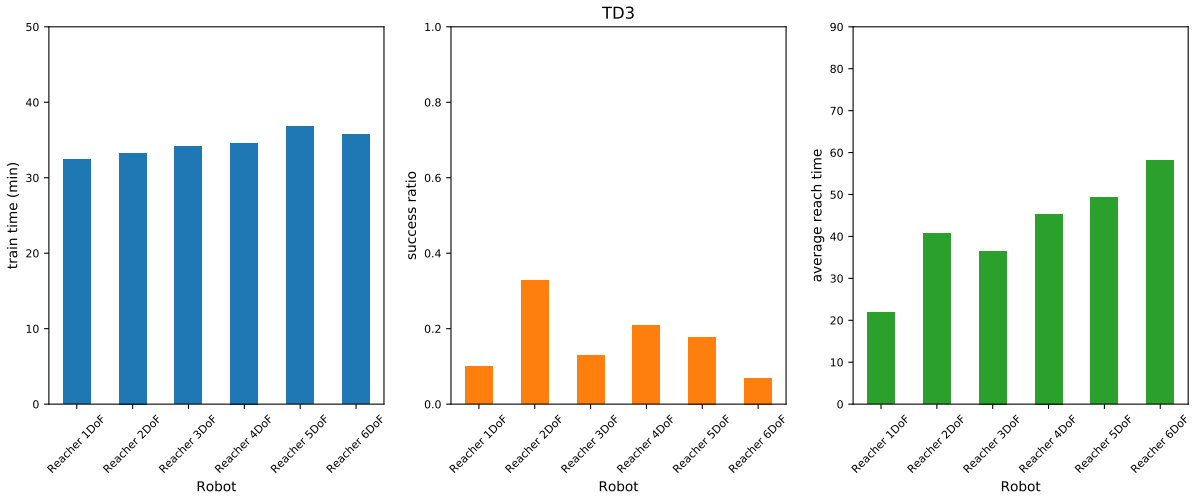

Figure 7: Performance metrics of the TD3 algorithm.

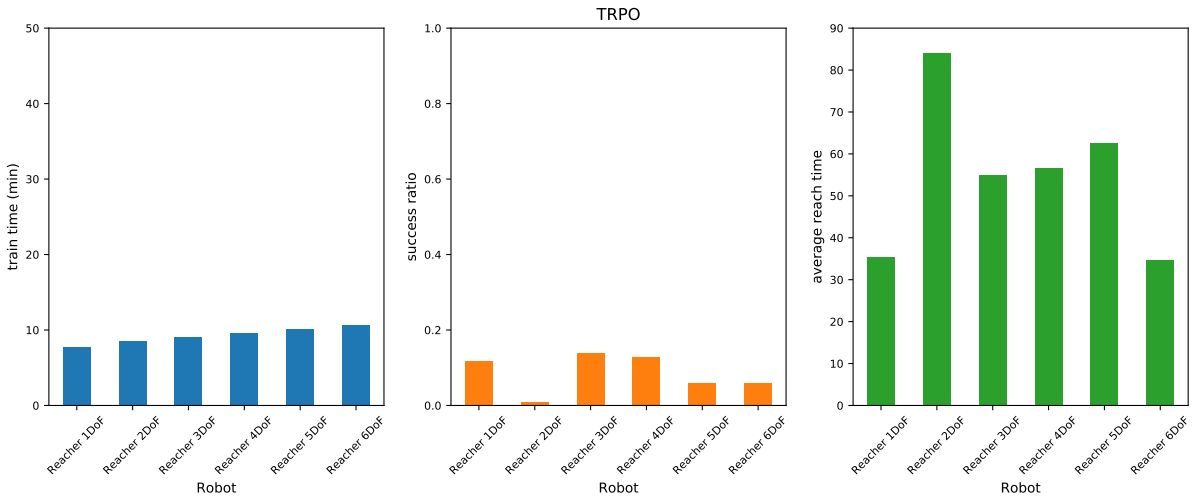

Figure 8: Performance metrics of the TRPO algorithm.

3 Performance plots - sorted by number of joints

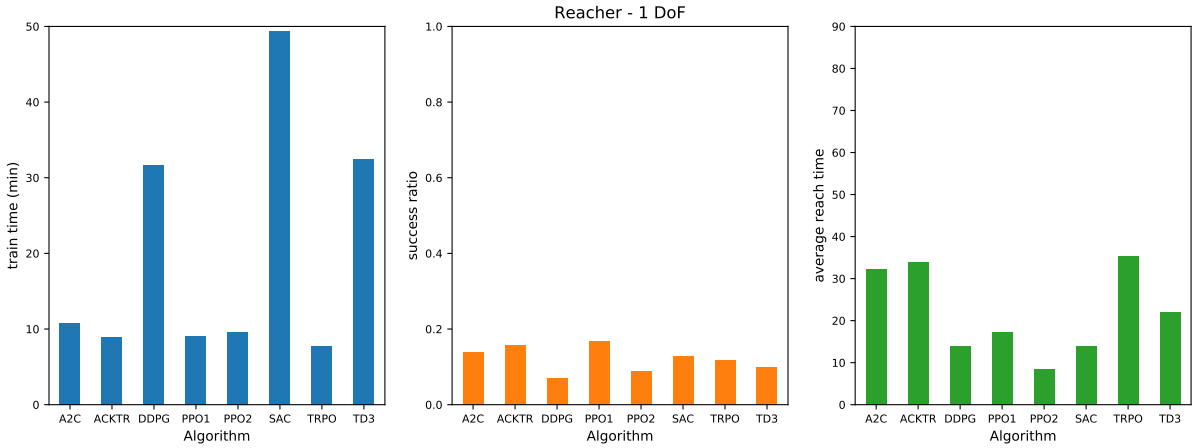

Figure 9: Performance metrics of the Reacher 1 DoF robot.

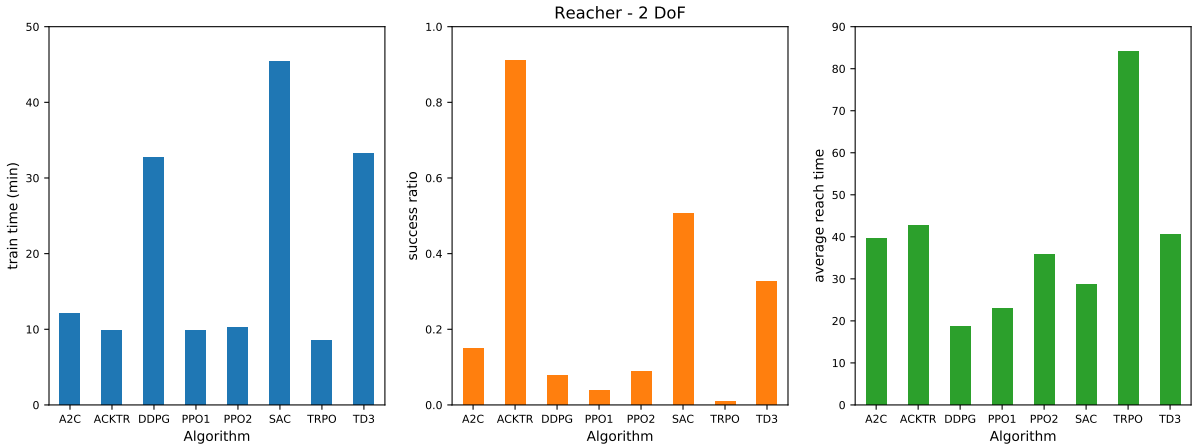

Figure 10: Performance metrics of the Reacher 2 DoF robot.

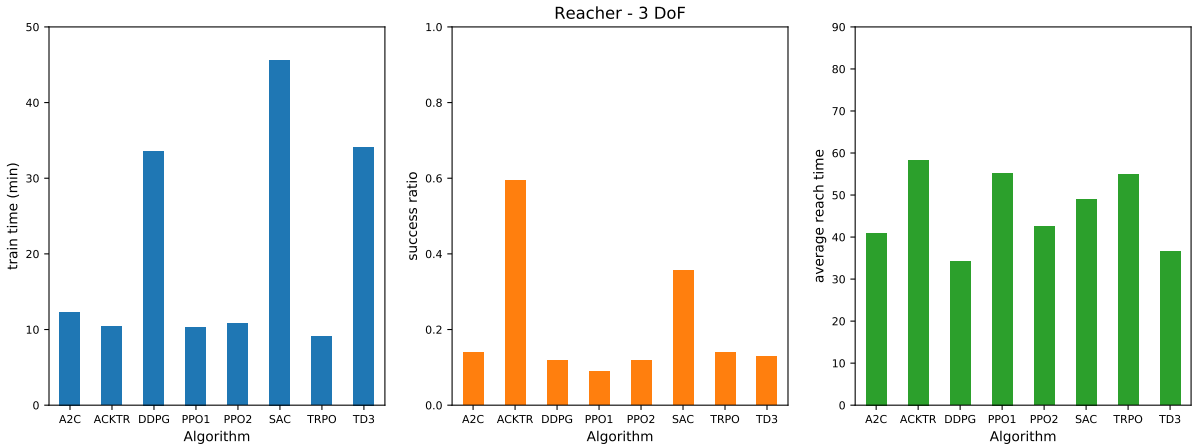

Figure 11: Performance metrics of the Reacher 3 DoF robot.

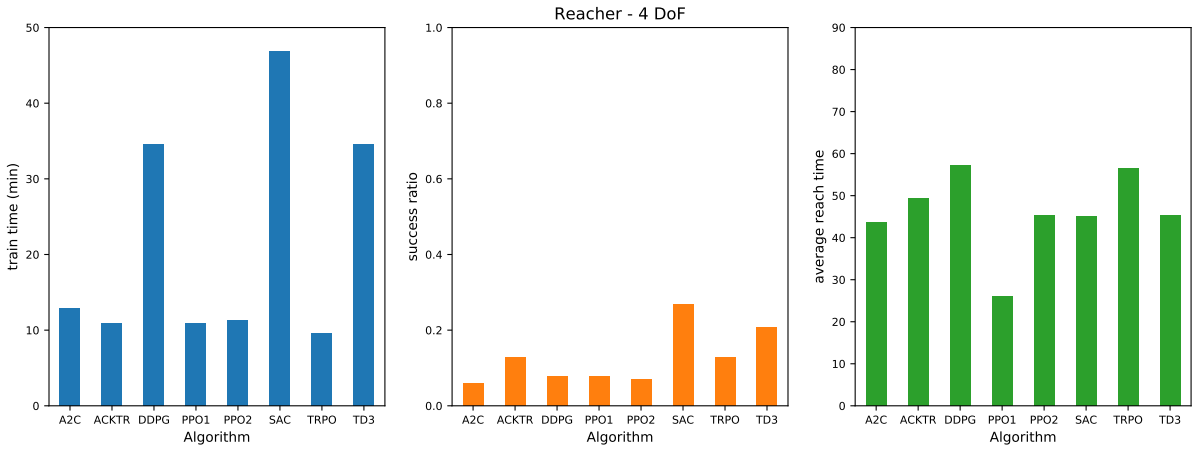

Figure 12: Performance metrics of the Reacher 4 DoF robot.

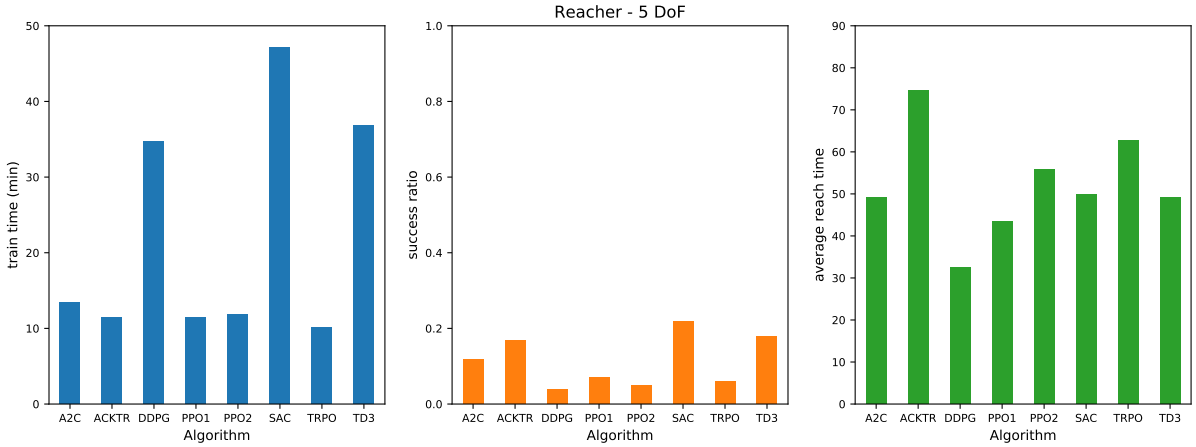

Figure 13: Performance metrics of the Reacher 5 DoF robot.

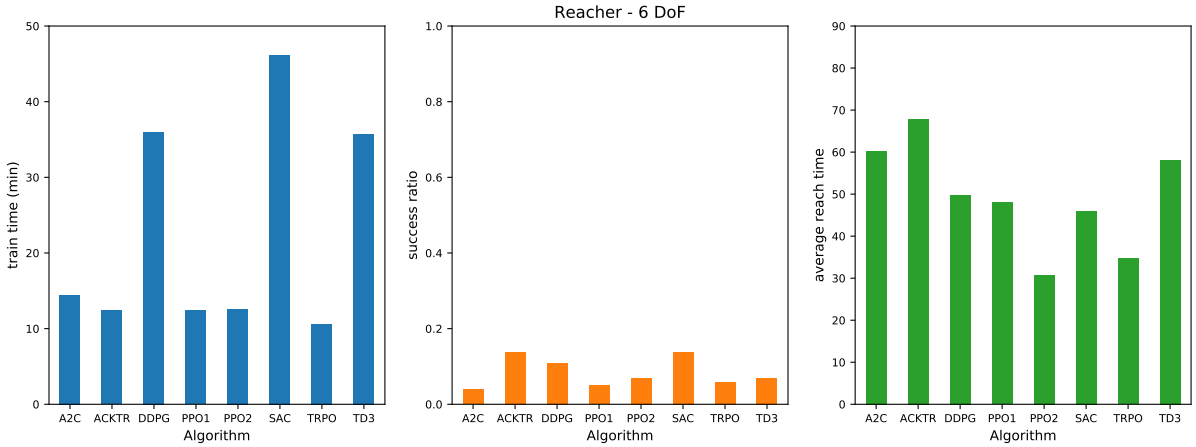

Figure 14: Performance metrics of the Reacher 6 DoF robot.
